DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 24-25 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The limitation of a second n-type transistor, lines 17-20 of claim 24, appears to be misdescriptive since the gate of the second n-type transistors (607 of fig. 6) does not coupled to respective gates of the third and fourth p-type transistors as recited in claim.

Claim 25 is rejected for being dependent on the rejected claim.

Claim Rejections - 35 USC § 102

- 3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:
 - (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
 - (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 4. Claims 26-29, 31-32 and 34 are rejected under 35 U.S.C. 102(b) as being anticipated by the Fayneh et al reference (U.S. Patent 6,329,882).

Application/Control Number: 10/770,435

Art Unit: 2816

Fayneh et al discloses in figure 2 an apparatus for carrying out a method of obtaining a current 222 from a charge pump 204 responsive to an input signal Fref, providing a bias current VBN to a circuit component in the circuit responsive to the current, and biasing the circuit component responsive to the bias current as required by claims 26 and 31.

As to claims 27-28, phase locked loop circuit and delay locked loop circuit are equivalent circuit as known in the art.

As to claim 29, Fayneh et al discloses the reference input signal being a clock reference signal (See Abstract).

As to claims 32 and 34, Fayneh et al discloses a phase mixer 202 and a clock buffer 228 as required by the claims.

5. Claims 1-9, 11-13, 15-23, 26-28 and 30-37 are rejected under 35 U.S.C. 102(e) as being anticipated by the Dietl et al (U.S. Patent 6,556,088).

Dietl et al discloses in figure 9 an apparatus comprising a voltage generator 95 for providing a current VBN representing frequency, an VCO 212 coupled to the voltage generator for providing a bias current V responsive to the current wherein the bias current being provided to a third circuit selected from the group consisting of a charge pump 91, a loop resistor 94,, a phase mixer 90, amplifier 93, clock buffer 97 and an equivalent 92 as required by claim 1-6. it is noted that there exists a current on an electrical conducting means due to resistivity of on a conducting means.

As to claim 7, Dietl et al discloses in figure 9 an apparatus comprising a phase-frequency detector 90 capable of providing a phase difference signal responsive to an input signal V0 and a feedback signal V, a first charge-pump 91, coupled to the phase-frequency detector, capable of

Application/Control Number: 10/770,435

Art Unit: 2816

providing a first voltage responsive to the phase difference signal, a second charge pump 92, coupled to the phase-frequency detector, capable of providing a second voltage responsive to the phase difference signal; a loop resistor 94, coupled to the first charge-pump, capable of providing a buffered voltage responsive to the first voltage, a voltage regulator 95, coupled to the loop resistor and the second charge pump, capable of providing a current responsive to the buffered voltage and the second voltage, wherein the voltage regulator includes a bias-generating device (see component 52 of figure 5) capable of providing a bias current VBN, a voltage-controlled oscillator 96, coupled to the voltage regulator, capable of providing the feedback signal responsive to the current, and an interconnect (i.e., connecting lines), coupled to the voltage regulator, the first charge pump, and the second charge pump, capable of providing the bias current as required by claim 7.

As to claim 8, figure 5 (showing detail of voltage regulator 95) discloses the biasgenerating device 52 comprising MOSFET device.

As to claim 9, figure 5 shows the MOSFET device being a p-type transistor having a drain coupled to the interconnect (by ways of other transistors) and a source coupled to a voltage source Vdd.

As to claims 11-13, the scopes of these claims are similar to that of claims 7-9. Therefore, they are rejected for the same reasons set forth above.

As to claim 15, figure 9 discloses a first circuit 94 capable of providing an output signal responsive to a comparison of an input signal V0 and a feedback signal V, and a second circuit 95, coupled to the first circuit, capable of providing a bias current VBN to the first circuit responsive to the input signal.

As to claims 16-18, figure 9 shows the first circuit including a first circuit component R being biased responsive to the bias current by way of charge pump 91.

As to claim 19, figure 5 (showing detail of voltage regulator 95) discloses the biasgenerating device 52 comprising MOSFET device.

As to claim 20, figure 5 shows the MOSFET device being a p-type transistor having a drain coupled to the interconnect (by ways of other transistors) and a source coupled to a voltage source Vdd.

As to claim 21, figure 9 is commonly known as a phase locked loop circuit.

As to claim 22, phase locked loop circuit and delay locked loop circuit are equivalent circuit as known in the art.

As to claim 23, figure 9 discloses the first circuit including a voltage-controlled oscillator 96 having an input (i.e., terminal coupled to VBN), and the second circuit being capable of generating the bias current VBN proportional to input current provided to the voltage-controlled oscillator input.

As to claims 26-28 and 30-36, they are rejected for reciting method/step derived from the apparatus of claims 1-3, 7, 15-19 and 21-22.

As to claim 37, the scope of claim is similar to that claim 15. therefore, it is rejected for the same reason set forth above.

Allowable Subject Matter

6. Claim 24 would be allowable if rewritten or amended to overcome the rejection(s) under 35 U.S.C. 112, 2nd paragraph, set forth in this Office action.

- 7. Claim 25 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, 2nd paragraph, set forth in this Office action and to include all of the limitations of the base claim and any intervening claims.
- 8. Claims 10 and 14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
- 9. The following is a statement of reasons for the indication of allowable subject matter: the prior art of record fails to discloses an apparatus comprising elements being configured as recited in claims. Specifically, none of the prior art teaches or fairly suggests, among other things, a voltage regulator comprising nine transistors being configured specifically as recited in claims 10, 14 and 24.

Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to An T. Luu whose telephone number is 571-272-1746. The examiner can normally be reached on 7:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Timothy P. Callahan can be reached on 571-272-1740. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
